Abstract:

The **AI-Powered Event Management System with QR-Based Attendance** is an intelligent web-based platform developed to simplify and enhance the process of organizing, managing, and analyzing events in educational institutions and organizations. Traditional event management approaches often involve manual registration, attendance recording, certificate distribution, and feedback analysis, which can be time-consuming, inefficient, and prone to errors. The proposed system provides a centralized solution that automates these activities while improving user experience and administrative efficiency. The system allows administrators to create and manage events, monitor registrations, and communicate with participants through a unified dashboard. Participants can register for events online and receive a unique QR code upon successful registration. During the event, attendance is recorded by scanning the QR code, ensuring a fast, secure, and contactless verification process. This eliminates manual attendance sheets and reduces the possibility of duplicate or fraudulent entries. To make event management more intelligent, the system incorporates Artificial Intelligence (AI) analytics. AI techniques are used to analyze participation trends, attendance statistics, and feedback data collected after events. Sentiment analysis is performed on participant feedback to identify satisfaction levels and highlight areas requiring improvement. The generated insights help organizers evaluate event performance and make informed decisions for future events. The platform also includes automated certificate generation, real-time event statistics, notifications, and comprehensive reporting features. By integrating AI-driven analytics with QR-based attendance tracking, the proposed system offers a modern, scalable, and data-driven approach to event management. It enhances operational efficiency, improves participant engagement, and supports effective planning and evaluation of events.
